Wallet Endpoints

These endpoints are available when we set:

config.toml

```
[wallet]
disable = false
```

This is the default value and we can possibly omit it.

Create Key Endpoint

Creates a private key. The private key is encrypted in the file and not visible to the user.

Parameters

Object:

- **String** - **alias**, name of the key.
- **String** - **password**, password of the key.
- **String** - **language**, mnemonic language of the key.

Optional:

- **String** - **mnemonic**, mnemonic of the key, create key by specified mnemonic.

Returns

Object:

- **String** - **alias**, name of the key.
- **String** - **xpub**, root pubkey of the key.
- **String** - **file**, path to the file of key.

Optional:

- **String** - **mnemonic**, mnemonic of the key, exist when the request mnemonic is null.

Example

Create key by random pattern:

Request

```
curl -X POST http://localhost:9888/create-key -d '{"alias": "alice", "password": "123456", "language": "en"}'
```

Response

```
{
  "alias": "alice",
  "xpub":
"a85e6eccb22f4c5fdade905f9a969003a17b6f35c237183a4313354b819a92689d52da3bcfe55f15a5508
77e8d789bd2bb9620f46e5049ea36470ab1b588a986",
  "file": "/home/yang/.eiyo/keystore/UTC--2024-3-10T07-09-17.509894697Z--341695b9-
9223-470c-a26d-bea210f8e1bb",
  "mnemonic": "verb smoke glory dentist annual peanut oval dragon fiction current
orbit lab load total language female mushroom coyote regular toy slide welcome employ
three"
}
```

Create key by specified mnemonic:

Request

```
curl -X POST http://localhost:9888/create-key -d '{"alias": "jack",
"password": "123456", "mnemonic": "please observe raw beauty blue sea believe then boat
float beyond position", "language": "en"}'
```

Response

```
{
  "alias": "jack",
  "xpub":
"c7bcb65feb31c6d900bc84c386d95c3d5b047090628d9bf5c51a848945b6986e99ff70388018a7681fa3

}
```

List Keys Endpoint

Returns the list of all available keys.

Parameters

None.

Returns

- **Array of Object**, keys owned by the client.
 - **Object**:
 - **String** - **alias**, name of the key.
 - **String** - **xpub**, pubkey of the key.

Example

Request a list of the current keys on the node.

Request

```
curl -X POST http://localhost:9888/list-keys
```

Response

```
[
  {
    "alias": "alice",
    "xpub":
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51cafffe767db42d3e6d69dbe211d1ca492ecf05908fe6

  }
]
```

Update Key Alias Endpoint

Update the alias for an existing key.

Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **new_alias**, new alias of the key.

Returns

Nothing in case the key alias is updated successfully.

Example

Update an existing key's alias.

Request

```
curl -X POST http://localhost:9888/update-key-alias -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "new_alias": "new_key"}'
```

Response

No response in case operation was successful.

Delete Key Endpoint

Deletes an existing key.

Please make sure that there is no balance in the related accounts.

Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **password**, password of the key.

Returns

Nothing in case the key is deleted successfully.

Example

Delete an existing key.

Request

```
curl -X POST {base-url}delete-key -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "password": "123456"}'
```

Response

No response in case operation was successful.

Check Key Password Endpoint

Check an existing key's password.

Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **password**, password of the key.

Returns

Object:

- **Boolean** - **check_result**, if check is successful the value will be true, otherwise it will be false.

Example

Check the password for an existing key.

Request

```
curl -X POST http://localhost:9888/check-key-password -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "password": "123456"}'
```

Response

```
{  
  "check_result": true  
}
```

Reset Key Password Endpoint

Reset an existing key's password.

Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **old_password**, old password of the key.
- **String** - **new_password**, new password of the key.

Returns

Object:

- **Boolean** - **changed**, if reset is successful the value will be true, otherwise it will be false.

Example

Reset the password for an existing key.

Request

```
curl -X POST http://localhost:9888/reset-key-password -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "old_password": "123456",  
"new_password": "654321"}'
```

Response

```
{  
  "changed": true  
}
```

Create Account Endpoint

Create an account to manage addresses.

Single sign account contains only one **root_xpubs** and quorum; however multi sign account can contain any number of **root_xpubs** and quorum.

Quorum is the number of verify signatures, the range is `[1, len(root_xpubs)]`.

Parameters

Object:

- **Array of String** - **root_xpubs**, pubkey array.
- **String** - **alias**, name of the account.
- **Integer** - **quorum**, the default value is **1**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

Optional:

- **String** - **access_token**, if optional when creating account locally. However, if you want to create account remotely, it's indispensable.

Returns

Object:

- **String** - **id**, account id.
- **String** - **alias**, name of account.
- **Integer** - **key_index**, key index of account.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.

Example

Create an account with a given **root_xpubs** and **alias**.

Request

```
curl -X POST http://localhost:9888/create-account -d
'{"root_xpubs":["2d6c07cb1ff7800b0793e300cd62b6ec5c0943d308799427615be451ef09c0304bee5dd492c6b13aaa854d303dc4f1dcb229f9578786e19c52d860803efa3b9a"],"quorum":1,"alias":"alice"}'
```

Response

```
{
  "alias": "alice",
  "id": "08F0663C00A02",
  "key_index": 1,
  "quorum": 1,
  "xpubs": [
    "2d6c07cb1ff7800b0793e300cd62b6ec5c0943d308799427615be451ef09c0304bee5dd492c6b13aaa854d303dc4f1dcb229f9578786e19c52d860803efa3b9a"
  ]
}
```

List Accounts Endpoint

Returns a list of the available accounts on the node.

Parameters

Optional:

- **String** - **id**, account id.
- **String** - **alias**, name of account.

Returns

- **Array of Object**, account array.
 - **Object**:
 - **String** - **id**, account id.
 - **String** - **alias**, name of account.
 - **Integer** - **key_index**, key index of account.
 - **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
 - **Array of Object** - **xpubs**, pubkey array.

Example

Request a list of the accounts present on the node.

Request

```
curl -X POST http://localhost:9888/list-accounts -d '{"alias":"alice"}'
```

Response

```
[
  {
    "alias": "alice",
    "id": "086KQD75G0A02",
    "key_index": 1,
    "quorum": 1,
    "xpubs": [
      "180aab8bf247932a7cf68da5cc9a873266279155097612f1e5fdda4add88d5e91e2e7ce5b736f3ac933824cdee9effcf1531b90dfcb388e5cc306d14e9a2c85e"
    ]
  }
]
```

Update Account Alias Endpoint

Updates an alias for the an existing account.

Parameters

Object: `account_alias` | `account_id`

* `String` - `new_alias`, new alias of account.

optional:

- `String` - `account_alias`, alias of account.
- `String` - `account_id`, id of account.

Returns

Nothing in case the account alias is updated successfully.

Example

Update the alias for a given account ID or an account alias.

Request

```
curl -X POST http://localhost:9888/update-account-alias -d '{"account_id":  
"08F0663C00A02", "new_alias": "new_account"}'  
# or  
curl -X POST http://localhost:9888/update-account-alias -d '{"account_alias": "alice",  
"new_alias": "new_account"}'
```

Response

No response in case operation was successful.

Delete Account Endpoint

Delete an existing account.

Please make sure that there is no balance in the related accounts.

Parameters

Object: `account_alias` | `account_id`

Optional:

- **String** - **account_alias**, alias of account.
- **String** - **account_id**, id of account.

Returns

Nothing if the account is deleted successfully.

Example

Delete an existing account by account ID or account alias.

Request

```
curl -X POST http://localhost:9888/delete-account -d '{"account_id": "08F0663C00A02"}'  
# or  
curl -X POST http://localhost:9888/delete-account -d '{"account_alias": "alice"}'
```

Response

No response in case operation was successful.

Create Account Receiver Endpoint

Creates an address and control program.

The address and control program are a one to one relationship.

In the **build-transaction** endpoint, the receiver is the address when the action is of type **control_address**, and the receiver is the control program when the action is of type **control_program**, both can be used to the same effect.

Parameters

Object: **account_alias** | **account_id**

Optional:

- **String** - **account_alias**, alias of account.
- **String** - **account_id**, id of account.

Returns

Object:

- **String** - **address**, address of account.
- **String** - **control_program**, control program of account.

Example

Create an account alias on the existing account ID.

Request

```
curl -X POST http://localhost:9888/create-account-receiver -d '{"account_alias": "alice", "account_id": "0BDQARM800A02"}'
```

Response

```
{
  "address": "ey1q5u8u4e1dhjf31vnkmyl78jj8a75neuryzlkkn0",
  "control_program": "0014a70fcae7edbc931fb276d93fe3ca47efa93cf064"
}
```

List Addresses Endpoint

Returns the sub list of all available addresses by account with a limit count.

Parameters

- **String** - **account_alias**, alias of account.
- **String** - **account_id**, id of account.
- **Integer** - **from**, the start position of first address
- **Integer** - **count**, the number of returned

Returns

- **Array of Object**, account address array.
 - **Object**:
 - **String** - **account_alias**, alias of account.
 - **String** - **account_id**, id of account.
 - **String** - **address**, address of account.
 - **Boolean** - **change**, whether the account address is change.

Example

List three addresses from first position by **account_id** or **account_alias**

Request

```
curl -X POST http://localhost:9888/list-addresses -d '{"account_alias": "alice",
```

```
"account_id": "086KQD75G0A02", "from": 0, "count": 3}'
```

Response

```
[
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qcn9lf7nxhswratvmg6d78nq7r7yupm36qgs55",
    "change": false
  },
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qew4h5uvt5ssrtg2alms0j77r94c30m78ucrcxy",
    "change": false
  },
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qgnp4lte7wge0rsekevjlrdh39vkzz0c2alheue",
    "change": false
  }
]
```

Validate Address Endpoint

Validate that the address is valid and report if it is local or not.

Parameters

Object:

- **string** - **address**, address of account.

Returns

Object:

- **Boolean** - **valid**, whether the account address is valid.
- **Boolean** - **is_local**, whether the account address is local.

Example

Request the validity of an address.

Request

```
curl -X POST http://localhost:9888/validate-address -d '{"address":  
"ey1qcn9lf7nxhswratvmg6d78nq7r7yupm36qgs55"}'
```

Response

```
{  
  "valid": true,  
  "is_local": true,  
}
```

Get Mining Address Endpoint

Query the current mining address.

Parameters

None.

Returns

Object:

- **String** - **mining_address**, the current mining address being used.

Example

Request the current mining address.

Request

```
curl -X POST http://localhost:9888/get-mining-address
```

Response

```
{  
  "mining_address": "ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"  
}
```

Set Mining Address Endpoint

Set the current mining address, no matter whether the address is a local one or not. It returns an error message if the address format is incorrect.

Parameters

Object:

- **String** - **mining_address**, mining address to set.

Returns

Object:

- **String** - **mining_address**, the new mining address.

Example

Update the node's mining address.

Request

```
curl -X POST http://localhost:9888/set-mining-address -d
'{"mining_address":"ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"}'
```

Response

```
{
  "mining_address":"ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"
}
```

Get Coinbase Arbitrary Endpoint

Get coinbase arbitrary.

Parameters

None.

Returns

Object:

- **String** - **arbitrary**, the arbitrary data append to coinbase, in hexadecimal format. (The full coinbase data for a block will be `0x00&block_height&arbitrary`.)

Example

Query for the coinbase arbitrary.

Request

```
curl -X POST http://localhost:9888/get-coinbase-arbitrary
```

Response

```
{
  "arbitrary": "ff"
}
```

Set Coinbase Arbitrary Endpoint

Set coinbase arbitrary.

Parameters

Object:

- **String** - **arbitrary**, the arbitrary data to be appended to coinbase, in hexadecimal format.

Returns

Object:

- **String** - **arbitrary**, the arbitrary data being appended to coinbase, in hexadecimal format. (The full coinbase data for a block will be `0x008block_height&arbitrary`.)

Example

Set the coinbase arbitrary.

Request

```
curl -X POST http://localhost:9888/set-coinbase-arbitrary -d '{"arbitrary": "ff"}'
```

Response

```
{
  "arbitrary": "ff"
}
```

List pubkeys Endpoint

Returns the list of all available **pubkeys** by account.

Parameters

Object: `account_alias` | `account_id` | `public_key`

Optional:

- `String` - `account_alias`, alias of account.
- `String` - `account_id`, id of account.
- `string` - `public_key`, public key.

Returns

Object:

- `String` - `root_xpub`, root xpub.
- **Array of Object** - `pubkey_infos`, public key array.
 - `String` - `pubkey`, public key.
 - `Object` - `derivation_path`, derivation path for root xpub.

Example

Query for the list of `pubkeys` by account ID or account alias.

Request

```
curl -X POST http://localhost:9888/list-pubkeys -d '{"account_id": "0G00LLUV00A02"}'
```

Response

```
{
  "pubkey_infos": [
    {
      "derivation_path": [
        "010100000000000000",
        "0100000000000000"
      ],
      "pubkey": "b7730319feac582056379548360da5c08258e248e5c29de08a97a6614df1425d"
    },
    {
      "derivation_path": [
        "010100000000000000",
        "0200000000000000"
      ],
      "pubkey": "5044a0d6113faaf4cb2550f63a820ab579a2af6134e503b76378490d5fe75af4"
    },
    {
      "derivation_path": [
```

```

    "010100000000000000",
    "0300000000000000"
  ],
  "pubkey": "ff5c28ce257b25c2a6e172ded490a708a8e654253836d92eb0a68b81ce63bea3"
}
],
"root_xpub":
"94a909319eac179f7694b99b8367b9c02b4414b95961e2e3a5bd887e0616af05a7c5e4448df92cd6cdfd8
2e57cd7aefc1ee0a7fd0d6a2194b5e5faf82556bedc"
}

```

Create Asset Endpoint

Create an asset definition, it prepares for the issuance of an asset.

Parameters

Object:

- **String** - **alias**, name of the asset.
- **Object** - **definition**, definition of asset.

Optional:(please pick one from the following two ways)

- **Array of String** - **root_xpubs**, xpub array.
- **Integer** - **quorum**, the default value is **1**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

or

- **String** - **issuance_program**, user-defined contract program.

Returns

Object:

- **String** - **id**, asset id.
- **String** - **alias**, name of the asset.
- **String** - **issuance_program**, control program of the issuance of asset.
- **Array of Object** - **keys**, information of asset pubkey.
- **String** - **definition**, definition of asset.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

Example

Create an asset by `xpubs`:

Request

```
curl -X POST http://localhost:9888/create-asset -d '{"alias": "GOLD", "root_xpubs": ["f6a16704f745a168642712060e6c5a69866147e21ec2447ae628f87d756bb68cc9b91405ad0a95f004090e864fde472f62ba97053ea109837bc89d63a64040d5"], "quorum": 1}'
```

Response

```
{

Get Asset Endpoint

Query asset details by asset ID.

Parameters

Object:

- **String** - **id**, id of asset.

Returns

Object:

- **String** - **id**, asset id.
- **String** - **alias**, name of the asset.
- **String** - **issuance_program**, control program of the issuance of asset.
- **Integer** - **key_index**, index of key for xpub.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.
- **String** - **type**, type of asset.
- **Integer** - **vm_version**, version of VM.
- **String** - **raw_definition_byte**, byte of asset definition.
- **Object** - **definition**, description of asset.

Example

Get asset details by asset ID.

Request

```
curl -X POST http://localhost:9888/get-asset -d '{"id":  
"50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730"}'
```

Response

```
{  
  "alias": "SILVER",  
  "definition": null,  
  "id": "50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730",

  ]  
}
```

List Assets Endpoint

Returns the list of all available assets.

Parameters

None.

Returns

- **Array of Object**, asset array.
 - **Object**:
 - **String** - **id**, asset id.
 - **String** - **alias**, name of the asset.
 - **String** - **issuance_program**, control program of the issuance of asset.
 - **Integer** - **key_index**, index of key for xpub.

- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.
- **String** - **type**, type of asset.
- **Integer** - **vm_version**, version of VM.
- **String** - **raw_definition_byte**, byte of asset definition.
- **Object** - **definition**, description of asset.

Example

List all the available assets.

Request

```
curl -X POST http://localhost:9888/list-assets -d '{}'
```

Response

```
[

    ]
  }
]

```

Update Asset Alias Endpoint

Update asset alias by assetID.

Parameters

Object:

- **String** - **id**, id of asset.
- **String** - **alias**, new alias of asset.

Returns

Nothing the asset alias is updated successfully.

Example

Update asset alias.

Request

```

curl -X POST http://localhost:9888/update-asset-alias -d
'{"id":"50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730",
"alias":"GOLD"}'

```

Response

No response in case operation was successful.

List Balances Endpoint

Returns the list of all available accounts' balances.

Parameters

Optional:

- **String** - **account_id**, account id.
- **String** - **account_alias**, name of account.

Returns

- **Array of Object**, balances owned by the account.
 - **Object**:
 - **String** - **account_id**, account id.
 - **String** - **account_alias**, name of account.
 - **String** - **asset_id**, asset id.
 - **String** - **asset_alias**, name of asset.
 - **Integer** - **amount**, specified asset balance of account.

Example

List all the available accounts' balances.

Request

```
curl -X POST http://localhost:9888/list-balances -d '{}'
```

Response

```
[
  {
    "account_alias": "default",
    "account_id": "0BDQ9AP100A02",
    "amount": 35508000000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  },
  {
    "account_alias": "alice",
    "account_id": "0BDQARM800A04",
    "amount": 600000000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  }
]
```

List available accounts' balances by a given **account_id**:

Request

```
curl -X POST http://localhost:9888/list-balances -d '{"account_id":"0BDQ9AP100A02"}'
```

Response

```
[
  {
    "account_alias": "default",
    "account_id": "0BDQ9AP100A02",
    "amount": 35508000000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  }
]
```

List Unspent Outputs Endpoint

Returns the sub list of all available unspent outputs for all accounts in your wallet.

Parameters

Object:

Optional:

- **String** - **id**, id of unspent output.
- **Boolean** - **unconfirmed**, is include unconfirmed **utxo**
- **Boolean** - **smart_contract**, is contract **utxo**
- **Integer** - **from**, the start position of first **utxo**
- **Integer** - **count**, the number of returned
- **String** - **account_id**, account id.
- **String** - **account_alias**, name of account.

Returns

- **Array of Object**, unspent output array.
 - **Object**:
 - **String** - **account_id**, account id.
 - **String** - **account_alias**, name of account.
 - **String** - **asset_id**, asset id.
 - **String** - **asset_alias**, name of asset.

- **Integer** - **amount**, specified asset balance of account.
- **String** - **address**, address of account.
- **Boolean** - **change**, whether the account address is change.
- **String** - **id**, unspent output id.
- **String** - **program**, program of account.
- **String** - **control_program_index**, index of program.
- **String** - **source_id**, source unspent output id.
- **String** - **source_pos**, position of source unspent output id in block.
- **String** - **valid_height**, valid height.

Example

List all the available unspent outputs:

Request

```
curl -X POST http://localhost:9888/list-unspent-outputs -d '{}'
```

Response

```
[

  "valid_height": 0
}

```

Backup Wallet Endpoint

Backs up a wallet to an image file, it contains the accounts' image, the assets' image and the keys' image.

Parameters

None.

Returns

Object:

- **Object** - **account_image**, account image.

- **Object** - **asset_image**, asset image.
- **Object** - **key_images**, key image.

Example

Request a backup of the node's wallet information.

Request

```
curl -X http://localhost:9888/backup-wallet -d '{}'
```

Response

```
{
  "account_image": {
    "slices": [
      {

```

Restore Wallet Endpoint

Restores the wallet by image file.

Parameters

Object:

- **Object** - **account_image**, account image.
- **Object** - **asset_image**, asset image.
- **Object** - **key_images**, key image.

Returns

None if restore of the wallet was successful.

Example

Restore a node's wallet via the image file.

Request

```
curl -X POST http://localhost:9888/restore-wallet -d
'{"account_image":{"slices":[{"account":{"type":"account","xpubs":["395d6e0ac25978c3f5

```

Response

No response in case operation was successful.

Rescan Wallet Endpoint

Trigger a rescan of the block information on the wallet.

Parameters

None.

Returns

Nothing if operation was a success.

Example

Request a rescan of the block information on the node.

Request

```
curl -X POST http://localhost:9888/rescan-wallet -d '{}'
```

Response

No response in case operation was successful.

Recovery Wallet Endpoint

Recovers a wallet and it's accounts from root **xpubs**.

All accounts and balances of **bip44** multi-account hierarchy for deterministic wallets can be restored via root **xpubs**.

Parameters

Object:

- **Object** - **xpubs**, root XPubs.

Returns

Status of recovery wallet operation.

Example

Request a wallet's recovery via **xpubs**.

Request

```
curl -X POST http://localhost:9888/recovery-wallet -d '{
  "xpubs":["c536a2c11fafd8278e02e9393dcbf5aa420eb51a1761a7e5da7f2b9b37969b52a8f8e2b692e7
dcaf79dfa0d1e28c63eb9fda42942f20feaa8a71b383d9a4668c"]}'
```

Response

```
{
  "status": "success"
}
```

Wallet Info Endpoint

Returns the wallet's information.

Parameters

None.

Returns

Object:

- **Integer** - **best_block_height**, current block height.
- **Integer** - **wallet_height**, current block height for wallet.

Example

Request the node's wallet information.

Request

```
curl -X POST http://localhost:9888/wallet-info -d '{}'
```

Response

```
{
  "best_block_height": 150,
  "wallet_height": 150
}
```

Sign Message Endpoint

Sign a message with the key password(decode encrypted private key) of an address.

Parameters

Object:

- **String** - **address**, address for account.
- **String** - **message**, message for signature by address xpub.
- **String** - **password**, password of account.

Returns

Object:

- **String** - **derived_xpub**, derived xpub.
- **String** - **signature**, signature of message.

Example

Request the signature of a message by an address' private key.

Request

```
curl -X POST http://localhost:9888/sign-message -d
'{"address":"ey1qx2qgvvjz734ur8x5lpfdtlau74aaa5djs0a5jn", "message":"this is a test
message", "password":"123456"}'
```

Response

```
{
  "signature":
"74da3d6572233736e3a439166719244dab57dd0047f8751b1efa2da26eeab251d915c1211dcad77e8b013
267b86d96e91ae67ff0be520ef4ec326e911410b609",
  "derived_xpub":

ee4b1a5f4749b7a8c74c8e7e6a1b0e5918ebd5df4d0"
}
```

Decode Program Endpoint

Decode a program.

Parameters

Object:

- **String** - **program**, program for account.

Returns

Object:

- **String** - **instructions**, instructions and data for program.

Example

Request to have a program decoded into it's instructions.

Request

```
curl -X POST http://localhost:9888/decode-program -d  
'{"program": "0014a86c83ee12e6d790fb388345cc2e2b87056a0773"}'
```

Response

```
{  
  "instructions": "DUP \nHASH160 \nDATA_20 a86c83ee12e6d790fb388345cc2e2b87056a0773  
\nEQUALVERIFY \nTXSIGHASH \nSWAP \nCHECKSIG \n"  
}
```

Network Endpoints

These endpoints are available regardless of the wallet being disabled or not.
