Parameters .....	89
Returns .....	89
Example .....	89

Set Mining Endpoint .....	89
Parameters .....	89
Returns .....	89
Example .....	89

## Wallet Endpoints

These endpoints are available when we set:

**config.toml**

```
[wallet]
disable = false
```

This is the default value and we can possibly omit it.

## Create Key Endpoint

Creates a private key. The private key is encrypted in the file and not visible to the user.

### Parameters

Object:

- **String** - **alias**, name of the key.
- **String** - **password**, password of the key.
- **String** - **language**, mnemonic language of the key.

Optional:

- **String** - **mnemonic**, mnemonic of the key, create key by specified mnemonic.

### Returns

Object:

- **String** - **alias**, name of the key.
- **String** - **xpub**, root pubkey of the key.
- **String** - **file**, path to the file of key.

Optional:

- **String** - **mnemonic**, mnemonic of the key, exist when the request mnemonic is null.

## Example

Create key by random pattern:

### Request

```
curl -X POST http://localhost:9888/create-key -d '{"alias": "alice", "password": "123456", "language": "en"}'
```

### Response

```
{
  "alias": "alice",
  "xpub":
"a85e6eccb22f4c5fdade905f9a969003a17b6f35c237183a4313354b819a92689d52da3bcfe55f15a5508
77e8d789bd2bb9620f46e5049ea36470ab1b588a986",
  "file": "/home/yang/.eiyaro/keystore/UTC--2024-3-10T07-09-17.509894697Z--341695b9-
9223-470c-a26d-bea210f8e1bb",
  "mnemonic": "verb smoke glory dentist annual peanut oval dragon fiction current
orbit lab load total language female mushroom coyote regular toy slide welcome employ
three"
}
```

Create key by specified mnemonic:

### Request

```
curl -X POST http://localhost:9888/create-key -d '{"alias": "jack",
"password": "123456", "mnemonic": "please observe raw beauty blue sea believe then boat
float beyond position", "language": "en"}'
```

### Response

```
{
  "alias": "jack",
  "xpub":
"c7bcb65feb31c6d900bc84c386d95c3d5b047090628d9bf5c51a848945b6986e99ff70388018a7681fa3
7a240dbd8df39a994c86f9314a61e75feb33563ca72",
  "file": "/home/yang/.eiyaro/keystore/UTC--2024-3-10T07-08-51.815030323Z--46ee932e-
88d3-4680-a5c1-dd9e63918fcc"
}
```

## List Keys Endpoint

Returns the list of all available keys.

## Parameters

None.

## Returns

- **Array of Object**, keys owned by the client.
  - **Object**:
    - **String** - **alias**, name of the key.
    - **String** - **xpub**, pubkey of the key.

## Example

Request a list of the current keys on the node.

### Request

```
curl -X POST http://localhost:9888/list-keys
```

### Response

```
[
  {
    "alias": "alice",
    "xpub":
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caff767db42d3e6d69dbe211d1ca492ecf05908fe6

  }
]
```

## Update Key Alias Endpoint

Update the alias for an existing key.

## Parameters

### Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **new\_alias**, new alias of the key.

## Returns

Nothing in case the key alias is updated successfully.

## Example

Update an existing key's alias.

### Request

```
curl -X POST http://localhost:9888/update-key-alias -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "new_alias": "new_key"}'
```

### Response

Nothing if the operation was successful.

## Delete Key Endpoint

Deletes an existing key.

Please make sure that there is no balance in the related accounts.

## Parameters

### Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **password**, password of the key.

## Returns

Nothing in case the key is deleted successfully.

## Example

Delete an existing key.

## Request

```
curl -X POST {base-url}delete-key -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "password": "123456"}'
```

## Response

Nothing if the operation was successful.

# Check Key Password Endpoint

Check an existing key's password.

## Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **password**, password of the key.

## Returns

Object:

- **Boolean** - **check\_result**, if check is successful the value will be true, otherwise it will be false.

## Example

Check the password for an existing key.

## Request

```
curl -X POST http://localhost:9888/check-key-password -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "password": "123456"}'
```

## Response

```
{  
  "check_result": true  
}
```

# Reset Key Password Endpoint

Reset an existing key's password.

## Parameters

Object:

- **String** - **xpub**, pubkey of the key.
- **String** - **old\_password**, old password of the key.
- **String** - **new\_password**, new password of the key.

## Returns

Object:

- **Boolean** - **changed**, if reset is successful the value will be true, otherwise it will be false.

## Example

Reset the password for an existing key.

### Request

```
curl -X POST http://localhost:9888/reset-key-password -d '{"xpub":  
"a7dae957c2d35b42efe7e6871cf5a75ebd2a0d0e51caffe767db42d3e6d69dbe211d1ca492ecf05908fe6  
fa625ad61b3253375ea744c9442dd5551613ba50aea", "old_password": "123456",  
"new_password": "654321"}'
```

### Response

```
{  
  "changed": true  
}
```

# Create Account Endpoint

Create an account to manage addresses.

Single sign account contains only one **root\_xpubs** and quorum; however multi sign account can contain any number of **root\_xpubs** and quorum.

Quorum is the number of verify signatures, the range is `[1, len(root_xpubs)]`.

## Parameters

Object:

- **Array of String** - **root\_xpubs**, pubkey array.
- **String** - **alias**, name of the account.
- **Integer** - **quorum**, the default value is **1**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

Optional:

- **String** - **access\_token**, if optional when creating account locally. However, if you want to create account remotely, it's indispensable.

## Returns

Object:

- **String** - **id**, account id.
- **String** - **alias**, name of account.
- **Integer** - **key\_index**, key index of account.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.

## Example

Create an account with a given **root\_xpubs** and **alias**.

### Request

```
curl -X POST http://localhost:9888/create-account -d
'{"root_xpubs":["2d6c07cb1ff7800b0793e300cd62b6ec5c0943d308799427615be451ef09c0304bee5dd492c6b13aaa854d303dc4f1dcb229f9578786e19c52d860803efa3b9a"],"quorum":1,"alias":"alice"}'
```

### Response

```
{
  "alias": "alice",
  "id": "08F0663C00A02",
  "key_index": 1,
  "quorum": 1,
  "xpubs": [
    "2d6c07cb1ff7800b0793e300cd62b6ec5c0943d308799427615be451ef09c0304bee5dd492c6b13aaa854d303dc4f1dcb229f9578786e19c52d860803efa3b9a"
  ]
}
```

# List Accounts Endpoint

Returns a list of the available accounts on the node.

## Parameters

Optional:

- **String** - **id**, account id.
- **String** - **alias**, name of account.

## Returns

- **Array of Object**, account array.
  - **Object**:
    - **String** - **id**, account id.
    - **String** - **alias**, name of account.
    - **Integer** - **key\_index**, key index of account.
    - **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
    - **Array of Object** - **xpubs**, pubkey array.

## Example

Request a list of the accounts present on the node.

### Request

```
curl -X POST http://localhost:9888/list-accounts -d '{"alias":"alice"}'
```

### Response

```
[
  {
    "alias": "alice",
    "id": "086KQD75G0A02",
    "key_index": 1,
    "quorum": 1,
    "xpubs": [
      "180aab8bf247932a7cf68da5cc9a873266279155097612f1e5fdda4add88d5e91e2e7ce5b736f3ac933824cdee9effcf1531b90dfcb388e5cc306d14e9a2c85e"
    ]
  }
]
```

## Update Account Alias Endpoint

Updates an alias for the an existing account.

### Parameters

**Object:** `account_alias` | `account_id`

\* `String` - `new_alias`, new alias of account.

optional:

- `String` - `account_alias`, alias of account.
- `String` - `account_id`, id of account.

### Returns

Nothing in case the account alias is updated successfully.

### Example

Update the alias for a given account ID or an account alias.

### Request

```
curl -X POST http://localhost:9888/update-account-alias -d '{"account_id":  
"08F0663C00A02", "new_alias": "new_account"}'  
# or  
curl -X POST http://localhost:9888/update-account-alias -d '{"account_alias": "alice",  
"new_alias": "new_account"}'
```

### Response

Nothing if the operation was successful.

## Delete Account Endpoint

Delete an existing account.

Please make sure that there is no balance in the related accounts.

### Parameters

**Object:** `account_alias` | `account_id`

Optional:

- **String** - **account\_alias**, alias of account.
- **String** - **account\_id**, id of account.

## Returns

Nothing if the account is deleted successfully.

## Example

Delete an existing account by account ID or account alias.

### Request

```
curl -X POST http://localhost:9888/delete-account -d '{"account_id": "08F0663C00A02"}'  
# or  
curl -X POST http://localhost:9888/delete-account -d '{"account_alias": "alice"}'
```

### Response

Nothing if the operation was successful.

## Create Account Receiver Endpoint

Creates an address and control program.

The address and control program are a one to one relationship.

In the **build-transaction** endpoint, the receiver is the address when the action is of type **control\_address**, and the receiver is the control program when the action is of type **control\_program**, both can be used to the same effect.

## Parameters

**Object:** **account\_alias** | **account\_id**

Optional:

- **String** - **account\_alias**, alias of account.
- **String** - **account\_id**, id of account.

## Returns

**Object:**

- **String** - **address**, address of account.
- **String** - **control\_program**, control program of account.

## Example

Create an account alias on the existing account ID.

### Request

```
curl -X POST http://localhost:9888/create-account-receiver -d '{"account_alias": "alice", "account_id": "0BDQARM800A02"}'
```

### Response

```
{
  "address": "ey1q5u8u4e1dhjf31vnkmyl78jj8a75neuryzlkkn0",
  "control_program": "0014a70fcae7edbc931fb276d93fe3ca47efa93cf064"
}
```

## List Addresses Endpoint

Returns the sub list of all available addresses by account with a limit count.

### Parameters

- **String** - **account\_alias**, alias of account.
- **String** - **account\_id**, id of account.
- **Integer** - **from**, the start position of first address
- **Integer** - **count**, the number of returned

### Returns

- **Array of Object**, account address array.
  - **Object**:
    - **String** - **account\_alias**, alias of account.
    - **String** - **account\_id**, id of account.
    - **String** - **address**, address of account.
    - **Boolean** - **change**, whether the account address is change.

## Example

List three addresses from first position by **account\_id** or **account\_alias**

### Request

```
curl -X POST http://localhost:9888/list-addresses -d '{"account_alias": "alice",
```

```
"account_id": "086KQD75G0A02", "from": 0, "count": 3}'
```

## Response

```
[
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qcn9lf7nxhswratvmg6d78nq7r7yupm36qgs55",
    "change": false
  },
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qew4h5uvt5ssrtg2alms0j77r94c30m78ucrcxy",
    "change": false
  },
  {
    "account_alias": "alice",
    "account_id": "086KQD75G0A02",
    "address": "ey1qgnp4lte7wge0rsekevjlrdh39vkzz0c2alheue",
    "change": false
  }
]
```

## Validate Address Endpoint

Validate that the address is valid and report if it is local or not.

### Parameters

Object:

- **string** - **address**, address of account.

### Returns

Object:

- **Boolean** - **valid**, whether the account address is valid.
- **Boolean** - **is\_local**, whether the account address is local.

### Example

Request the validity of an address.

## Request

```
curl -X POST http://localhost:9888/validate-address -d '{"address":  
"ey1qcn9lf7nxhswratvmg6d78nq7r7yupm36qgs55"}'
```

## Response

```
{  
  "valid": true,  
  "is_local": true,  
}
```

# Get Mining Address Endpoint

Query the current mining address.

## Parameters

None.

## Returns

Object:

- **String** - **mining\_address**, the current mining address being used.

## Example

Request the current mining address.

## Request

```
curl -X POST http://localhost:9888/get-mining-address
```

## Response

```
{  
  "mining_address": "ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"  
}
```

# Set Mining Address Endpoint

Set the current mining address, no matter whether the address is a local one or not. It returns an error message if the address format is incorrect.

## Parameters

Object:

- **String** - **mining\_address**, mining address to set.

## Returns

Object:

- **String** - **mining\_address**, the new mining address.

## Example

Update the node's mining address.

## Request

```
curl -X POST http://localhost:9888/set-mining-address -d
'{"mining_address":"ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"}'
```

## Response

```
{
  "mining_address":"ey1qnhr65jq3q9gf8uymza8vp0ew8tfyh642wddxh6"
}
```

# Get Coinbase Arbitrary Endpoint

Get coinbase arbitrary.

## Parameters

None.

## Returns

Object:

- **String** - **arbitrary**, the arbitrary data append to coinbase, in hexadecimal format. (The full coinbase data for a block will be `0x00&block_height&arbitrary`.)

## Example

Query for the coinbase arbitrary.

## Request

```
curl -X POST http://localhost:9888/get-coinbase-arbitrary
```

## Response

```
{
  "arbitrary": "ff"
}
```

# Set Coinbase Arbitrary Endpoint

Set coinbase arbitrary.

## Parameters

Object:

- **String** - **arbitrary**, the arbitrary data to be appended to coinbase, in hexadecimal format.

## Returns

Object:

- **String** - **arbitrary**, the arbitrary data being appended to coinbase, in hexadecimal format. (The full coinbase data for a block will be `0x008block_height&arbitrary`.)

## Example

Set the coinbase arbitrary.

## Request

```
curl -X POST http://localhost:9888/set-coinbase-arbitrary -d '{"arbitrary": "ff"}'
```

## Response

```
{
  "arbitrary": "ff"
}
```

# List pubkeys Endpoint

Returns the list of all available **pubkeys** by account.

## Parameters

**Object:** `account_alias` | `account_id` | `public_key`

Optional:

- `String` - `account_alias`, alias of account.
- `String` - `account_id`, id of account.
- `string` - `public_key`, public key.

## Returns

**Object:**

- `String` - `root_xpub`, root xpub.
- **Array of Object** - `pubkey_infos`, public key array.
  - `String` - `pubkey`, public key.
  - `Object` - `derivation_path`, derivation path for root xpub.

## Example

Query for the list of `pubkeys` by account ID or account alias.

### Request

```
curl -X POST http://localhost:9888/list-pubkeys -d '{"account_id": "0G00LLUV00A02"}'
```

### Response

```
{
  "pubkey_infos": [
    {
      "derivation_path": [
        "010100000000000000",
        "0100000000000000"
      ],
      "pubkey": "b7730319feac582056379548360da5c08258e248e5c29de08a97a6614df1425d"
    },
    {
      "derivation_path": [
        "010100000000000000",
        "0200000000000000"
      ],
      "pubkey": "5044a0d6113faaf4cb2550f63a820ab579a2af6134e503b76378490d5fe75af4"
    },
    {
      "derivation_path": [
```

```

    "010100000000000000",
    "0300000000000000"
  ],
  "pubkey": "ff5c28ce257b25c2a6e172ded490a708a8e654253836d92eb0a68b81ce63bea3"
}
],
"root_xpub":
"94a909319eac179f7694b99b8367b9c02b4414b95961e2e3a5bd887e0616af05a7c5e4448df92cd6cdfd8
2e57cd7aefc1ee0a7fd0d6a2194b5e5faf82556bedc"
}

```

## Create Asset Endpoint

Create an asset definition, it prepares for the issuance of an asset.

### Parameters

Object:

- **String** - **alias**, name of the asset.
- **Object** - **definition**, definition of asset.

Optional:(please pick one from the following two ways)

- **Array of String** - **root\_xpubs**, xpub array.
- **Integer** - **quorum**, the default value is **1**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

or

- **String** - **issuance\_program**, user-defined contract program.

### Returns

Object:

- **String** - **id**, asset id.
- **String** - **alias**, name of the asset.
- **String** - **issuance\_program**, control program of the issuance of asset.
- **Array of Object** - **keys**, information of asset pubkey.
- **String** - **definition**, definition of asset.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.

## Example

Create an asset by **xpubs**:

### Request

```
curl -X POST http://localhost:9888/create-asset -d '{"alias": "GOLD", "root_xpubs": ["f6a16704f745a168642712060e6c5a69866147e21ec2447ae628f87d756bb68cc9b91405ad0a95f004090e864fde472f62ba97053ea109837bc89d63a64040d5"], "quorum": 1}'
```

### Response

```
{
  "id": "3c1cf4c9436e3f942cb2f1d70a584f1c61df3697698daccdc89e46f46a003d0",
  "alias": "GOLD",
  "issuance_program":
  "766baa209683b893483c0a5a317bf9868a8e2a09691f8aa8c1f3e2a7bb62b157e76712e05151ad696c00c0",
  "keys": [
    {
      "root_xpub":
      "f6a16704f745a168642712060e6c5a69866147e21ec2447ae628f87d756bb68cc9b91405ad0a95f004090e864fde472f62ba97053ea109837bc89d63a64040d5",
      "asset_pubkey":
      "9683b893483c0a5a317bf9868a8e2a09691f8aa8c1f3e2a7bb62b157e76712e012bd443fa7d56a0627df0a29dffcdc52641672a0f5cba54d104ad76eb8b8dfc3",
      "asset_derivation_path": [
        "000200000000000000"
      ]
    }
  ],
  "quorum": 1,
  "definition": {}
}
```

Create an asset by **issuance\_program**:

### Request

```
curl -X POST http://localhost:9888/create-asset -d '{"alias": "TESTASSET", "issuance_program": "20e9108d3ca8049800727f6a3505b3a2710dc579405dde03c250f16d9a7e1e6e78160014c5a5b563c4623018557fb299259542b8739f6bc20163201e074b22ed7ae8470c7ba5d8a7bc95e83431a753a17465e8673af68a82500c22741a547a6413000000007b7b51547ac1631a000000547a547aae7cac00c0", "definition": {"name": "TESTASSET", "symbol": "TESTASSET", "decimals": 8, "description": {}}}'
```

## Response

```
{
  "id": "59621aa82c047bd21f73711d4a7905b7a9fbb49bc1a3fdc309b13807cc8b9094",
  "alias": "TESTASSET",
  "issuance_program":
    "20e9108d3ca8049800727f6a3505b3a2710dc579405dde03c250f16d9a7e1e6e78160014c5a5b563c4623

  }
}
```

## Get Asset Endpoint

Query asset details by asset ID.

### Parameters

Object:

- **String** - **id**, id of asset.

### Returns

Object:

- **String** - **id**, asset id.
- **String** - **alias**, name of the asset.
- **String** - **issuance\_program**, control program of the issuance of asset.
- **Integer** - **key\_index**, index of key for xpub.
- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.
- **String** - **type**, type of asset.
- **Integer** - **vm\_version**, version of VM.
- **String** - **raw\_definition\_byte**, byte of asset definition.
- **Object** - **definition**, description of asset.

## Example

Get asset details by asset ID.

### Request

```
curl -X POST http://localhost:9888/get-asset -d '{"id":  
"50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730"}'
```

### Response

```
{  
  "alias": "SILVER",  
  "definition": null,  
  "id": "50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730",  
  "issue_program":  
    "ae2029cd61d9ef31d40af7541f9a50831d6317fdb0870249d0564fcfa9a8f843589c5151ad",  
  "key_index": 1,  
  "quorum": 1,  
  "raw_definition_byte": "",  
  "type": "asset",  
  "vm_version": 1,  
  "xpubs": [  
  
    "34b16ee500615cd325f8b84099f83c1ebecaca67977c5dc9b71ae32ceaf18207f996b0a9725b901d37926  
    89b2babcb60febe3b81a684d9b56b65f67f307d453d"  
  ]  
}
```

## List Assets Endpoint

Returns the list of all available assets.

### Parameters

None.

### Returns

- **Array of Object**, asset array.
  - **Object**:
    - **String** - **id**, asset id.
    - **String** - **alias**, name of the asset.
    - **String** - **issuance\_program**, control program of the issuance of asset.
    - **Integer** - **key\_index**, index of key for xpub.

- **Integer** - **quorum**, threshold of keys that must sign a transaction to spend asset units controlled by the account.
- **Array of Object** - **xpubs**, pubkey array.
- **String** - **type**, type of asset.
- **Integer** - **vm\_version**, version of VM.
- **String** - **raw\_definition\_byte**, byte of asset definition.
- **Object** - **definition**, description of asset.

## Example

List all the available assets.

### Request

```
curl -X POST http://localhost:9888/list-assets -d '{}'
```

### Response

```
[
  {
    "alias": "EY",
    "definition": {
      "decimals": 8,

    ]
  }
]

```

## Update Asset Alias Endpoint

Update asset alias by assetID.

### Parameters

Object:

- **String** - **id**, id of asset.
- **String** - **alias**, new alias of asset.

### Returns

Nothing the asset alias is updated successfully.

### Example

Update asset alias.

### Request

```

curl -X POST http://localhost:9888/update-asset-alias -d
'{"id":"50ec80b6bc48073f6aa8fa045131a71213c33f3681203b15ddc2e4b81f1f4730",
"alias":"GOLD"}'

```

### Response

Nothing if the operation was successful.

## List Balances Endpoint

Returns the list of all available accounts' balances.

## Parameters

Optional:

- **String** - **account\_id**, account id.
- **String** - **account\_alias**, name of account.

## Returns

- **Array of Object**, balances owned by the account.
  - **Object**:
    - **String** - **account\_id**, account id.
    - **String** - **account\_alias**, name of account.
    - **String** - **asset\_id**, asset id.
    - **String** - **asset\_alias**, name of asset.
    - **Integer** - **amount**, specified asset balance of account.

## Example

List all the available accounts' balances.

### Request

```
curl -X POST http://localhost:9888/list-balances -d '{}'
```

### Response

```
[
  {
    "account_alias": "default",
    "account_id": "0BDQ9AP100A02",
    "amount": 35508000000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  },
  {
    "account_alias": "alice",
    "account_id": "0BDQARM800A04",
    "amount": 600000000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  }
]
```

List available accounts' balances by a given **account\_id**:

## Request

```
curl -X POST http://localhost:9888/list-balances -d '{"account_id":"0BDQ9AP100A02"}'
```

## Response

```
[
  {
    "account_alias": "default",
    "account_id": "0BDQ9AP100A02",
    "amount": 3550800000000,
    "asset_alias": "EY",
    "asset_id": "ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff"
  }
]
```

# List Unspent Outputs Endpoint

Returns the sub list of all available unspent outputs for all accounts in your wallet.

## Parameters

Object:

Optional:

- **String** - **id**, id of unspent output.
- **Boolean** - **unconfirmed**, is include unconfirmed **utxo**
- **Boolean** - **smart\_contract**, is contract **utxo**
- **Integer** - **from**, the start position of first **utxo**
- **Integer** - **count**, the number of returned
- **String** - **account\_id**, account id.
- **String** - **account\_alias**, name of account.

## Returns

- **Array of Object**, unspent output array.
  - **Object**:
    - **String** - **account\_id**, account id.
    - **String** - **account\_alias**, name of account.
    - **String** - **asset\_id**, asset id.
    - **String** - **asset\_alias**, name of asset.

- **Integer** - **amount**, specified asset balance of account.
- **String** - **address**, address of account.
- **Boolean** - **change**, whether the account address is change.
- **String** - **id**, unspent output id.
- **String** - **program**, program of account.
- **String** - **control\_program\_index**, index of program.
- **String** - **source\_id**, source unspent output id.
- **String** - **source\_pos**, position of source unspent output id in block.
- **String** - **valid\_height**, valid height.

## Example

List all the available unspent outputs:

### Request

```
curl -X POST http://localhost:9888/list-unspent-outputs -d '{}'
```

### Response

```
[
  {
    "account_alias": "alice",

  "valid_height": 0
}

```

## Backup Wallet Endpoint

Backs up a wallet to an image file, it contains the accounts' image, the assets' image and the keys' image.

### Parameters

None.

### Returns

Object:

- **Object** - **account\_image**, account image.

- **Object** - **asset\_image**, asset image.
- **Object** - **key\_images**, key image.

## Example

Request a backup of the node's wallet information.

### Request

```
curl -X http://localhost:9888/backup-wallet -d '{}'
```

### Response

```
{
  "account_image": {
    "slices": [
      {
        "account": {

# Restore Wallet Endpoint

Restores the wallet by image file.

## Parameters

Object:

- **Object** - **account\_image**, account image.
- **Object** - **asset\_image**, asset image.
- **Object** - **key\_images**, key image.

## Returns

Nothing if the operation was successful.

## Example

Restore a node's wallet via the image file.

## Request

```
curl -X POST http://localhost:9888/restore-wallet -d
'{"account_image":{"slices":[{"account":{"type":"account","xpubs":["395d6e0ac25978c3f5

364c4808c94383d50fb0681"]}]}'
```

## Response

Nothing if the operation was successful.

# Rescan Wallet Endpoint

Trigger a rescan of the block information on the wallet.

## Parameters

None.

## Returns

Nothing if operation was a success.

## Example

Request a rescan of the block information on the node.

## Request

```
curl -X POST http://localhost:9888/rescan-wallet -d '{}'
```

## Response

Nothing if the operation was successful.

# Recovery Wallet Endpoint

Recovers a wallet and it's accounts from root **xpubs**.

All accounts and balances of **bip44** multi-account hierarchy for deterministic wallets can be restored via root **xpubs**.

## Parameters

**Object**:

- **Object** - **xpubs**, root XPubs.

## Returns

Status of recovery wallet operation.

## Example

Request a wallet's recovery via **xpubs**.

## Request

```
curl -X POST http://localhost:9888/recovery-wallet -d '{  
  "xpubs":["c536a2c11fafd8278e02e9393dcbf5aa420eb51a1761a7e5da7f2b9b37969b52a8f8e2b692e7  
  dcaf79dfa0d1e28c63eb9fda42942f20feaa8a71b383d9a4668c"]}'
```

## Response

```
{  
  "status": "success"  
}
```

# Wallet Info Endpoint

Returns the wallet's information.

## Parameters

None.

## Returns

Object:

- **Integer** - **best\_block\_height**, current block height.
- **Integer** - **wallet\_height**, current block height for wallet.

## Example

Request the node's wallet information.

## Request

```
curl -X POST http://localhost:9888/wallet-info -d '{}'
```

## Response

```
{  
  "best_block_height": 150,  
  "wallet_height": 150  
}
```

# Sign Message Endpoint

Sign a message with the key password(decode encrypted private key) of an address.

## Parameters

Object:

- **String** - **address**, address for account.
- **String** - **message**, message for signature by address xpub.
- **String** - **password**, password of account.

## Returns

Object:

- **String** - **derived\_xpub**, derived xpub.
- **String** - **signature**, signature of message.

## Example

Request the signature of a message by an address' private key.

### Request

```
curl -X POST http://localhost:9888/sign-message -d
'{"address":"ey1qx2qgvvjz734ur8x5lpfdtlau74aaa5djs0a5jn", "message":"this is a test
message", "password":"123456"}'
```

### Response

```
{
  "signature":
"74da3d6572233736e3a439166719244dab57dd0047f8751b1efa2da26eeab251d915c1211dcad77e8b013

ee4b1a5f4749b7a8c74c8e7e6a1b0e5918ebd5df4d0"
}
```

# Decode Program Endpoint

Decode a program.

## Parameters

Object:

- **String** - **program**, program for account.

## Returns

Object:

- **String** - **instructions**, instructions and data for program.

## Example

Request to have a program decoded into it's instructions.

### Request

```
curl -X POST http://localhost:9888/decode-program -d
'{"program": "0014a86c83ee12e6d790fb388345cc2e2b87056a0773"}'
```

### Response

```
{
  "instructions": "DUP \nHASH160 \nDATA_20 a86c83ee12e6d790fb388345cc2e2b87056a0773
\nEQUALVERIFY \nTXSIGHASH \nSWAP \nCHECKSIG \n"
}
```

## Get Transaction Endpoint

Query the account related transaction by transaction ID.

## Parameters

Object:

- **String** - **tx\_id**, transaction id, hash of transaction.

## Returns

Object:

- **String** - **tx\_id**, transaction id, hash of the transaction.
- **Integer** - **block\_time**, the unix timestamp for when the request was responded.
- **String** - **block\_hash**, hash of the block where this transaction was in.
- **Integer** - **block\_height**, block height where this transaction was in.

- **Integer** - **block\_index**, position of the transaction in the block.
- **Integer** - **block\_transactions\_count**, transactions count where this transaction was in the block.
- **Boolean** - **status\_fail**, whether the state of the transaction request has failed.
- **Integer** - **size**, size of transaction.
- **Array of Object** - **inputs**, object of inputs for the transaction.
  - **String** - **type**, the type of input action, available option include: 'spend', 'issue', 'coinbase'.
  - **String** - **asset\_id**, asset id.
  - **String** - **asset\_alias**, name of asset.
  - **Object** - **asset\_definition**, definition of asset(json object).
  - **Integer** - **amount**, amount of asset.
  - **Object** - **issuance\_program**, issuance program, it only exist when type is 'issue'.
  - **Object** - **control\_program**, control program of account, it only exist when type is 'spend'.
  - **String** - **address**, address of account, it only exist when type is 'spend'.
  - **String** - **spent\_output\_id**, the front of outputID to be spent in this input, it only exist when type is 'spend'.
  - **String** - **account\_id**, account id.
  - **String** - **account\_alias**, name of account.
  - **Object** - **arbitrary**, arbitrary infomation can be set by miner, it only exist when type is 'coinbase'.
  - **String** - **input\_id**, hash of input action.
  - **Array of String** - **witness\_arguments**, witness arguments.
- **Array of Object** - **outputs**, object of outputs for the transaction.
  - **String** - **type**, the type of output action, available option include: 'retire', 'control'.
  - **String** - **id**, outputid related to utxo.
  - **Integer** - **position**, position of outputs.
  - **String** - **asset\_id**, asset id.
  - **String** - **asset\_alias**, name of asset.
  - **Object** - **asset\_definition**, definition of asset(json object).
  - **Integer** - **amount**, amount of asset.
  - **String** - **account\_id**, account id.
  - **String** - **account\_alias**, name of account.
  - **Object** - **control\_program**, control program of account.
  - **String** - **address**, address of account.

## Example

Retrieve a transaction by it ID.

### Request

```
curl -X POST http://localhost:9888/get-transaction -d '{"tx_id":  
"15b8d66e227feff47b3de0f278934ea16d6c828371ec6c13c8f84713dd11703b"}'

```

## List Transactions Endpoint

Returns the sub list of all the account related transactions.

### Parameters

**Object:**

**Optional:**

- **String** - **id**, transaction id, hash of transaction.

- **String** - **account\_id**, id of account.
- **Boolean** - **detail**, flag of detail transactions, default false (only return transaction summary)
- **Boolean** - **unconfirmed**, flag of unconfirmed transactions(query result include all confirmed and unconfirmed transactions), default false.
- **Integer** - **from**, the start position of first transaction
- **Integer** - **count**, the number of returned

## Returns

**Array of Object**, transaction array.

Optional:

- **Object**:(summary transaction)
  - **String** - **tx\_id**, transaction id, hash of the transaction.
  - **Integer** - **block\_time**, the unix timestamp for when the request was responded.
  - **Array of Object** - **inputs**, object of summary inputs for the transaction.
    - **String** - **type**, the type of input action, available option include: 'spend', 'issue', 'coinbase'.
    - **String** - **asset\_id**, asset id.
    - **String** - **asset\_alias**, name of asset.
    - **Integer** - **amount**, amount of asset.
    - **String** - **account\_id**, account id.
    - **String** - **account\_alias**, name of account.
    - **Object** - **arbitrary**, arbitrary information can be set by miner, it only exist when type is 'coinbase'.
  - **Array of Object** - **outputs**, object of summary outputs for the transaction.
    - **String** - **type**, the type of output action, available option include: 'retire', 'control'.
    - **String** - **asset\_id**, asset id.
    - **String** - **asset\_alias**, name of asset.
    - **Integer** - **amount**, amount of asset.
    - **String** - **account\_id**, account id.
    - **String** - **account\_alias**, name of account.
    - **Object** - **arbitrary**, arbitrary information can be set by miner, it only exist when type is input 'coinbase'(this place is empty).
- **Object**:(detail transaction)
  - **String** - **tx\_id**, transaction id, hash of the transaction.
  - **Integer** - **block\_time**, the unix timestamp for when the request was responded.
  - **String** - **block\_hash**, hash of the block where this transaction was in.

- **Integer** - **block\_height**, block height where this transaction was in.
- **Integer** - **block\_index**, position of the transaction in the block.
- **Integer** - **block\_transactions\_count**, transactions count where this transaction was in the block.
- **Boolean** - **status\_fail**, whether the state of the transaction request has failed.
- **Integer** - **size**, size of transaction.
- **Array of Object** - **inputs**, object of inputs for the transaction.
  - **String** - **type**, the type of input action, available option include: 'spend', 'issue', 'coinbase'.
  - **String** - **asset\_id**, asset id.
  - **String** - **asset\_alias**, name of asset.
  - **Object** - **asset\_definition**, definition of asset(json object).
  - **Integer** - **amount**, amount of asset.
  - **Object** - **issuance\_program**, issuance program, it only exist when type is 'issue'.
  - **Object** - **control\_program**, control program of account, it only exist when type is 'spend'.
  - **String** - **address**, address of account, it only exist when type is 'spend'.
  - **String** - **spent\_output\_id**, the front of outputID to be spent in this input, it only exist when type is 'spend'.
  - **String** - **account\_id**, account id.
  - **String** - **account\_alias**, name of account.
  - **Object** - **arbitrary**, arbitrary infomation can be set by miner, it only exist when type is 'coinbase'.
  - **String** - **input\_id**, hash of input action.
  - **Array of String** - **witness\_arguments**, witness arguments.
- **Array of Object** - **outputs**, object of outputs for the transaction.
  - **String** - **type**, the type of output action, available option include: 'retire', 'control'.
  - **String** - **id**, outputid related to utxo.
  - **Integer** - **position**, position of outputs.
  - **String** - **asset\_id**, asset id.
  - **String** - **asset\_alias**, name of asset.
  - **Object** - **asset\_definition**, definition of asset(json object).
  - **Integer** - **amount**, amount of asset.
  - **String** - **account\_id**, account id.
  - **String** - **account\_alias**, name of account.
  - **Object** - **control\_program**, control program of account.
  - **String** - **address**, address of account.

## Example

List all the available transactions:

### Request

```
curl -X POST http://localhost:9888/list-transactions -d '{}'
```

### Response

```
[
  {
    "block_time": 1521771059,
    "inputs": [
      {
        "arbitrary": "06",
        "asset_id":
"0000000000000000000000000000000000000000000000000000000000000000",
        "type": "coinbase"
      }
    ],
    "outputs": [
      {
        "account_alias": "default",
        "account_id": "0BMHBOBVG0A02",
        "amount": 4125000000,
        "asset_alias": "EY",
        "asset_id":
"ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff",
        "type": "control"
      }
    ],
    "tx_id": "c631a8de401913a512c338bcf4a61cb2de6cede12a7385d9d11637eaa6578f33"
  },
  {
    "block_time": 1521770515,
    "inputs": [
      {
        "account_alias": "default",
        "account_id": "0BMHBOBVG0A02",
        "amount": 4125000000,
        "asset_alias": "EY",
        "asset_id":
"ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff",
        "type": "spend"
      }
    ],
    "outputs": [
      {
```

```

    "account_alias": "default",
    "account_id": "0BMHBOBVG0A02",
    "amount": 34649500000,
    "asset_alias": "EY",
    "asset_id":

    "type": "control"
  }
],
"tx_id": "1151ce5c7b32b8755b5e48109ec7ed956fb1783eaea9558bf5a2ad957825e4b7"
}
]

```

List the transaction matching the given `tx_id` with detail:

### Request

```

curl -X POST http://localhost:9888/list-transactions -d '{"id":
"7e9f9b999381da936e3cae48b5bac2b9bc28bb56c6c862be6c110448f7e2f6b3","detail": true}'

```

### Response

```

## Build Transaction Endpoint

Build transaction.

### Parameters

Object:

- **String** - **base\_transaction**, base data for the transaction, default is null.
- **Integer** - **ttl**, integer of the time to live in milliseconds, it means utxo will be reserved(locked) for build transaction in this time range, if the transaction will not to be submitted into block, it will be auto unlocked for build transaction again after this ttl time. it will be set to 5 minutes(300 seconds) defaultly when ttl is 0.
- **Integer** - **time\_range**, the block height at which this transaction will be allowed to be included in a block. If the block height of the main chain exceeds this value, the transaction will expire and no longer be valid.
- **Array of Object** - **actions**:
  - **Object**:
    - **String** - **account\_id** | **account\_alias**, (type is spend\_account) alias or ID of account.
    - **String** - **asset\_id** | **asset\_alias**, (type is spend\_account, issue, retire, control\_program and control\_address) alias or ID of asset.
    - **Integer** - **amount**, (type is spend\_account, issue, retire, control\_program and

control\_address) the specified asset of the amount sent with this transaction.

- **String- type**, type of transaction, valid types: 'spend\_account', 'issue', 'spend\_account\_unspent\_output', 'control\_address', 'control\_program', 'retire'.
- **String - address**, (type is control\_address) address of receiver, the style of address is P2PKH or P2SH.
- **String - control\_program**, (type is control\_program) control program of receiver.
- **String - use\_unconfirmed**, (type is spend\_account and spend\_account\_unspent\_output) flag of use unconfirmed UTXO, default is false.
- **String - arbitrary**, (type is retire) arbitrary additional data by hexadecimal.
- **Array of Object - arguments**, (type is issue and spend\_account\_unspent\_output) arguments of contract, null when it's not contract.
  - **String- type**, type of argument, valid types: 'raw\_tx\_signature', 'data'.
  - **Object- raw\_data**, json object of argument content.
    - **String- xpub**, (type is raw\_tx\_signature) root xpub.
    - **String- derivation\_path**, (type is raw\_tx\_signature) derived path.
    - **String- value**, (type is data) string of binary value.

## Returns

- **Object of build-transaction - transaction**, built transaction.

## Example

Build transaction of type **spend**.

### Request

```

## Build Chain Transactions Endpoint

Build chain transactions. To solve the problem of excessive **utxo** causing the transaction to fail, the **utxo** merge will be performed automatically. Currently, only **EY** transactions are supported.

This feature requires the **core** software to be higher than **v1.0.1**.

### Parameters

Object:

- **String** - **base\_transaction**, base data for the transaction, default is null.
- **Integer** - **ttl**, integer of the time to live in milliseconds, it means utxo will be reserved(locked) for builded transaction in this time range, if the transaction will not to be submitted into block, it will be auto unlocked for build transaction again after this ttl time. it will be set to 5 minutes(300 seconds) defaultly when ttl is 0.
- **Integer** - **time\_range**, time stamp(block height)is maximum survival time for the transaction, the transaction will be not submit into block after this time stamp.
- **Array of Object** - **actions**:
  - **Object**:
    - **String** - **account\_id** | **account\_alias**, (type is spend\_account) alias or ID of account.
    - **String** - **asset\_id** | **asset\_alias**, (type is spend\_account, issue, retire, control\_program and control\_address) alias or ID of asset.

- **Integer** - **amount**, (type is spend\_account, issue, retire, control\_program and control\_address) the specified asset of the amount sent with this transaction.
- **String**- **type**, type of transaction, valid types: 'spend\_account', 'issue', 'spend\_account\_unspent\_output', 'control\_address', 'control\_program', 'retire'.
- **String** - **address**, (type is control\_address) address of receiver, the style of address is P2PKH or P2SH.
- **String** - **control\_program**, (type is control\_program) control program of receiver.
- **String** - **use\_unconfirmed**, (type is spend\_account and spend\_account\_unspent\_output) flag of use unconfirmed UTXO, default is false.
- **Array of Object** - **arguments**, (type is issue and spend\_account\_unspent\_output) arguments of contract, null when it's not contract.
  - **String**- **type**, type of argument, valid types: 'raw\_tx\_signature', 'data'.
  - **Object**- **raw\_data**, json object of argument content.
    - **String**- **xpub**, (type is raw\_tx\_signature) root xpub.
    - **String**- **derivation\_path**, (type is raw\_tx\_signature) derived path.
    - **String**- **value**, (type is data) string of binary value.

## Returns

- **Object of raw\_transaction** - **raw\_transaction**, builded transactions.
- **Object of signing\_instructions** - **signing\_instructions**, Information used to sign a transactions.

## Example

Build chain transaction of type **spend**.

### Request

```
curl -X POST http://localhost:9888//build-chain-transactions -d '{"base_transaction": null, "actions": [{"account_id": "0JCH28A600A02", "amount": 30000500000000, "asset_id": "ffff ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff", "type": "spend_account"}, {"amount": 300004900000000, "asset_id": "ffff ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff", "address": "sm1qx93sge8jkgzcl7pled7uqr596hjm2xe558lkr", "type": "control_address"}], "ttl": 1000000, "time_range": 0}'

## Sign Transaction Endpoint

Sign a transaction.

### Parameters

Object:

- **String** - **password**, signature of the password.
- **Object** - **transaction**, builded transaction.

### Returns

Object:

- **Boolean** - **sign\_complete**, returns true if sign succesfully and false otherwise.
- **Object of sign-transaction** - **transaction**, signed transaction.

### Example

Perform the signature of a transaction.

### Request

```

curl -X POST http://localhost:9888/sign-transaction -d
'{"password":"123456","transaction":{"allow_additional_actions":false,"local":true,"raw_transaction":"07010000020161015fb6a63a3361170afca03c9d5ce1f09fe510187d69545e09f95548

## Sign Transactions Endpoint

Sign transactions used for batch signing transactions.

### Parameters

Object:

- **String** - **password**, signature of the password.
- **Object** - **transaction**, build transactions.

### Returns

Object:

- **Boolean** - **sign\_complete**, returns true if sign successfully and false otherwise.
- **Object of sign-transactions** - **transaction**, signed transactions.

### Example

Perform the signature of a batch of transactions.

### Request

```
curl -X POST http://localhost:9888/sign-transactions -d  
'{"password":"123456","transactions":[{"raw_transaction":"0701000201620160a0d36052ca3d

## Network Endpoints

These endpoints are available regardless of the wallet being disabled or not.

### Submit Transaction Endpoint

Submit transaction.

#### Parameters

Object:

- **Object** - **raw\_transaction**, **raw\_transaction** of signed transaction.

#### Returns

Object:

- **String** - **tx\_id**, transaction id, hash of transaction.

## Example

Submit a raw transaction.

### Request

```
curl -X POST http://localhost:9888/submit-transaction -d
'{"raw_transaction": "07010000010161015ffe8bdb49bbd08f711a54f0fbed4141b74c276de44c83199

# Estimate Transaction Gas Endpoint

Estimate consumed neu( $1EY = 10^8 NEU$ ) for the transaction.

## Parameters

Object:

- **Object** - **transaction\_template**, builded transaction response.

## Returns

Object:

- **Integer** - **total\_neu**, total consumed neu( $1EY = 10^8 NEU$ ) for execute transaction, **total\_neu** is rounded up **storage\_neu** + **vm\_neu**.
- **Integer** - **storage\_neu**, consumed neu for storage transaction .
- **Integer** - **vm\_neu**, consumed neu for execute VM.

## Example

Query about a transaction's gas.

### Request

```
curl -X POST http://localhost:9888/estimate-transaction-gas -d
'{"transaction_template":{"allow_additional_actions":false,"raw_transaction":"07010001

## Create Access Token Endpoint

Create a named access token that provides basic authentication for the HTTP protocol.  
This endpoint returns a token containing a username and password, separated by a colon.

### Parameters

Object:

- **String** - **id**, token ID.

Optional:

- **String** - **type**, type of token.

### Returns

Object:

- **String** - **token**, access token, authentication username and password are separated by a colon.

- **String** - **id**, token ID.
- **String** - **type**, type of token.
- **Object** - **created\_at**, time to create token.

## Example

Create an named access token.

### Request

```
curl -X POST http://localhost:9888/create-access-token -d '{"id":"token1"}'
```

### Response

```
{
  "token": "token1:1fee70f537128a201338bd5f25a3adbf33dad02eae4f4c9ac43f336a069df8f3",
  "id": "token1",
  "created_at": "2024-03-20T18:56:01.043919771+08:00"
}
```

## List Access Tokens Endpoint

Returns the list of all available access tokens.

### Parameters

None.

### Returns

- **Array of Object**, access token array.
  - **Object**:
    - **String** - **token**, access token.
    - **String** - **id**, token ID.
    - **String** - **type**, type of token.
    - **Object** - **created\_at**, time to create token.

## Example

List all the available access tokens.

### Request

```
curl -X POST http://localhost:9888/list-access-tokens -d '{}'
```

## Response

```
[
  {
    "token":
"token1:1fee70f537128a201338bd5f25a3adbf33dad02eae4f4c9ac43f336a069df8f3",
    "id": "token1",
    "created_at": "2024-03-20T18:56:01.043919771+08:00"
  },
  {
    "token": "alice:78598c6d9fb9e3258d01f78005d4e5725ad0d45e20af90a30b577b407d4a2edd",
    "id": "alice",
    "created_at": "2024-03-20T18:56:01.043919771+08:00"
  }
]
```

## Delete Access Token Endpoint

Delete existing access token.

### Parameters

Object:

- **String** - **id**, token ID.

### Returns

Nothing if the access token is deleted successfully.

### Example

Delete an existing access token.

### Request

```
curl -X POST http://localhost:9888/delete-access-token -d '{"id": "token1"}'
```

### Response

Nothing if the operation was successful.

# Check Access Token Endpoint

Check if an access token is valid.

## Parameters

Object:

- **String** - **id**, token ID.
- **String** - **secret**, secret of token, the second part of the colon division for token.

## Returns

None if the access token's validity checks out.

## Example

Check whether the access token is valid or not.

## Request

```
curl -X POST http://localhost:9888/check-access-token -d '{"id": "token1", "secret": "1fee70f537128a201338bd5f25a3adbf33dad02eae4f4c9ac43f336a069df8f3"}'
```

## Response

Nothing if the operation was successful.

# Create Transaction Feed Endpoint

Create a transaction feed.

## Parameters

Object:

- **String** - **alias**, name of the transaction feed.
- **String** - **filter**, filter of the transaction feed.

## Returns

None if the transaction feed is created successfully.

## Example

Create a transaction feed by alias.

## Request

```
curl -X POST http://localhost:9888/create-transaction-feed -d '{"alias": "test1",  
"filter": "asset_id='84778a666fe453cf73b2e8c783dbc9e04bc4fd7cbb4f50caeae99cf9967ebed'  
AND amount_lower_limit = 50 AND amount_upper_limit = 100"}'
```

## Response

Nothing if the operation was successful.

# Get Transaction Feed Endpoint

Query details of a transaction feed by alias.

## Parameters

Object:

- **String** - **alias**, alias of the transaction feed.

## Returns

Object:

- **String** - **id**, id of the transaction feed.
- **String** - **alias**, alias of the transaction feed.
- **String** - **filter**, filter of the transaction feed.
- **Object** - **param**, param of the transaction feed.
  - **String** - **assetid**, asset id.
  - **Integer** - **lowerlimit**, the lower limit of asset amount.
  - **Integer** - **upperlimit**, the upper limit of asset amount.
  - **String** - **transtype**, type of transaction.

## Example

List the available transaction feed by alias.

## Request

```
curl -X POST http://localhost:9888/get-transaction-feed -d '{"alias": "test1"}'
```

## Response

```
{
```

```
"alias": "test1",
"filter":
"asset_id='84778a666fe453cf73b2e8c783dbc9e04bc4fd7cbb4f50caeaae99cf9967ebed' AND
amount_lower_limit = 50 AND amount_upper_limit = 100",
"param": {}
}
```

## List Transaction Feeds Endpoint

Returns the list of all available transaction feeds.

### Parameters

None.

### Returns

- **Array of Object**, the transaction feeds.
  - **Object**:
    - **String** - **id**, id of the transaction feed.
    - **String** - **alias**, name of the transaction feed.
    - **String** - **filter**, filter of the transaction feed.
    - **Object** - **param**, param of the transaction feed.
      - **String** - **assetid**, asset id.
      - **Integer** - **lowerlimit**, the lower limit of asset amount.
      - **Integer** - **upperlimit**, the upper limit of asset amount.
      - **String** - **transtype**, type of transaction.

### Example

List all the available **txfeed**.

### Request

```
curl -X POST http://localhost:9888/list-transaction-feeds -d '{}'
```

### Response

```
[
{
  "alias": "test1",
  "filter":
  "asset_id='84778a666fe453cf73b2e8c783dbc9e04bc4fd7cbb4f50caeaae99cf9967ebed' AND
```

```
amount_lower_limit = 50 AND amount_upper_limit = 100",
  "param": {}
},
{
  "alias": "test2",
  "filter":
"asset_id='cee6a588cc3fc280749021ef42d5209952a1e6feceada4e69dd8a424ad22b199' AND
amount_lower_limit = 30 AND amount_upper_limit = 100",
  "param": {}
}
]
```

## Delete Transaction Feed Endpoint

Delete a transaction feed by alias.

### Parameters

Object:

- **String** - **alias**, alias of the transaction feed.

### Returns

Nothing if the transaction feed is deleted successfully.

### Example

Delete a transaction feed by it's alias.

### Request

```
curl -X POST http://localhost:9888/delete-transaction-feed -d '{"alias": "test1"}'
```

### Response

Nothing if the operation was successful.

## Update Transaction Feed Endpoint

Update transaction feed.

### Parameters

Object:

- **String** - **alias**, name of the transaction feed.

- **String** - **filter**, filter of the transaction feed.

## Returns

Nothing if the transaction feed is updated success.

## Example

Deleted when the **txfeed** exists, and recreate it with alias and filter:

## Request

```
curl -X POST http://localhost:9888/update-transaction-feed -d '{"alias": "test1",  
"filter": "asset_id='84778a666fe453cf73b2e8c783dbc9e04bc4fd7cbb4f50caeae99cf9967ebed'  
AND amount_lower_limit = 60 AND amount_upper_limit = 80"}'
```

## Response

Nothing if the operation was successful.

# Get Unconfirmed Transaction Endpoint

Query **mempool** transaction by transaction ID.

## Parameters

**Object**:

- **String** - **tx\_id**, transaction id, hash of transaction.

## Returns

**Object**:

- **String** - **id**, transaction id, hash of the transaction.
- **Integer** - **version**, version of transaction.
- **Integer** - **size**, size of transaction.
- **Integer** - **time\_range**, the time range of transaction.
- **Boolean** - **status\_fail**, whether the state of the request has failed.
- **String** - **mux\_id**, the previous transaction mux id(wallet enable can be acquired, this place is empty).
- **Array of Object** - **inputs**, object of inputs for the transaction(input struct please refer to get-transaction API description).
- **Array of Object** - **outputs**, object of outputs for the transaction(output struct please refer to get-transaction API description).

## Example

Retrieve a transaction from the `mempool` by `tx_id`.

### Request

```
curl -X POST http://localhost:9888/get-unconfirmed-transaction -d '{"tx_id": "382090f24fbfc2f737fa7372b9d161a43f00d1c597a7130a56589d1f469d04b5"}'
```

### Response

```

## List Unconfirmed Transactions Endpoint

Returns the total number of **mempool** transactions and the list of transaction IDs.

### Parameters

None.

### Returns

Object:

- **Integer** - **total**, version of transaction.
- **Array of Object** - **tx\_ids**, list of transaction id.

### Example

Retrieve the total of **mempool** transactions and their respective IDs.

### Request

```
curl -X POST http://localhost:9888/list-unconfirmed-transactions -d '{}'
```

### Response

```

{
  "total": 2,
  "tx_ids": [
    "382090f24fbfc2f737fa7372b9d161a43f00d1c597a7130a56589d1f469d04b5",
    "fc2da5dfa094c2170144f149fa07a312983157aec0ec95063a1319eedcb2d23b"
  ]
}

```

# Decode Raw Transaction Endpoint

Decode a serialized transaction hex string into a JSON object describing the transaction.

## Parameters

Object:

- **String** - **raw\_transaction**, hexstring of raw transaction.

## Returns

Object:

- **String** - **tx\_id**, transaction ID.
- **Integer** - **version**, version of transaction.
- **String** - **size**, size of transaction.
- **String** - **time\_range**, time range of transaction.
- **String** - **fee**, fee for sending transaction.
- **Array of Object** - **inputs**, object of inputs for the transaction(input struct please refer to get-transaction API description).
- **Array of Object** - **outputs**, object of outputs for the transaction

## Example

Ask for a decoded transaction from the contents of a raw transaction.

### Request

```
curl -X POST http://localhost:9888/decode-raw-transaction -d '{"raw_transaction":
"070100010161015fc8215913a270d3d953ef431626b19a89adf38e2486bb235da732f0afed515299ffffff

}

```

## Get Block Count Endpoint

Returns the current block height for the blockchain.

## Parameters

None.

## Returns

Object:

- **Integer** - **block\_count**, recent block height of the blockchain.

## Example

Retrieve the current block height.

### Request

```
curl -X POST http://localhost:9888/get-block-count
```

### Response

```
{
  "block_count": 519
}
```

## Get Block Hash Endpoint

Returns the current block hash for the block height of the blockchain.

## Parameters

None.

## Returns

Object:

- **String** - **block\_hash**, recent block hash of the blockchain.

## Example

Retrieves the block's hash for the current block height.

### Request

```
curl -X http://localhost:9888/POST get-block-hash
```

## Response

```
{
  "block_hash": "997bf5cecb4df097991a7a121a7fd3cb5a404fa856e3d6032c791ac07bc7c74c"
}
```

## Get Block Endpoint

Returns the details of a block by block height or block hash.

### Parameters

**Object:** **block\_height** | **block\_hash**

Optional:

- **String** - **block\_hash**, hash of block.
- **Integer** - **block\_height**, height of block.

### Returns

**Object:**

- **String** - **hash**, hash of block.
- **Integer** - **size**, size of block.
- **Integer** - **version**, version of block.
- **Integer** - **height**, height of block.
- **String** - **previous\_block\_hash**, previous block hash.
- **Integer** - **timestamp**, timestamp of block.
- **Integer** - **nonce**, nonce value.
- **Integer** - **bits**, bits of difficulty.
- **String** - **difficulty**, difficulty value(String type).
- **String** - **transaction\_merkle\_root**, merkle root of transaction.
- **String** - **transaction\_status\_hash**, merkle root of transaction status.
- **Array of Object** - **transactions**, transaction object:
  - **String** - **id**, transaction id, hash of the transaction.
  - **Integer** - **version**, version of transaction.
  - **Integer** - **size**, size of transaction.
  - **Integer** - **time\_range**, the unix timestamp for when the request was responded.
  - **Boolean** - **status\_fail**, whether the state of the request has failed.
  - **String** - **mux\_id**, the previous transaction mux id(source id of utxo).

- **Array of Object - inputs**, object of inputs for the transaction.
  - **String - type**, the type of input action, available option include: 'spend', 'issue', 'coinbase'.
  - **String - asset\_id**, asset id.
  - **String - asset\_alias**, name of asset.
  - **Object - asset\_definition**, definition of asset(json object).
  - **Integer - amount**, amount of asset.
  - **Object - issuance\_program**, issuance program, it only exist when type is 'issue'.
  - **Object - control\_program**, control program of account, it only exist when type is 'spend'.
  - **String - address**, address of account, it only exist when type is 'spend'.
  - **String - spent\_output\_id**, the front of outputID to be spent in this input, it only exist when type is 'spend'.
  - **String - account\_id**, account id.
  - **String - account\_alias**, name of account.
  - **Object - arbitrary**, arbitrary infomation can be set by miner, it only exist when type is 'coinbase'.
  - **String - input\_id**, hash of input action.
  - **Array of String - witness\_arguments**, witness arguments.
- **Array of Object - outputs**, object of outputs for the transaction.
  - **String - type**, the type of output action, available option include: 'retire', 'control'.
  - **String - id**, outputid related to utxo.
  - **Integer - position**, position of outputs.
  - **String - asset\_id**, asset id.
  - **String - asset\_alias**, name of asset.
  - **Object - asset\_definition**, definition of asset(json object).
  - **Integer - amount**, amount of asset.
  - **String - account\_id**, account id.
  - **String - account\_alias**, name of account.
  - **Object - control\_program**, control program of account.
  - **String - address**, address of account.

## Example

Get specified block information by **block\_hash** or **block\_height**, if both exists, the block result is queried by hash.

## Request

```
curl -X POST http://localhost:9888/get-block -d '{"block_height": 43, "block_hash":
```

```
"886a8e85b275e7d65b569ba510875c0e63dece1a94569914d7624c0dac8002f9"}'
```

## Response

```

## Get Block Header Endpoint

Returns the details of a block header by block height or block hash.

### Parameters

**Object:** `block_height` | `block_hash`

Optional:

- **String** - `block_hash`, hash of block.
- **Integer** - `block_height`, height of block.

### Returns

**Object:**

- **Object** - `block_header`, header of block.
- **Integer** - `reward`, reward.

### Example

Retrieve the block header details.

### Request

```
curl -X POST http://localhost:9888/get-block-header -d '{"block_height": 43,  
"block_hash": "886a8e85b275e7d65b569ba510875c0e63dece1a94569914d7624c0dac8002f9"}'
```

### Response

```
{  
  "block_header":  
    "01019601e87da37e7d73f31d54304c719c9058ec7bc7de7819deda89a7c8834a99bc05b8fbdbe6d60540e  
ba9e5d5cb79fd87b3cfad32f6772c1e4483f2a070e093a6176d85226d986a8c9c377e5192668bc0a367e4  
a4764f11e7c725eccdd1d7b6a492974fab1b6d5bc00ad918480808080801e",  
  "reward": 41250000000  
}
```

# Get Difficulty Endpoint

Returns the block difficulty by block height or block hash.

## Parameters

Object:

Optional:

- **String** - **block\_hash**, hash of block.
- **Integer** - **block\_height**, height of block.

## Returns

Object:

- **Integer** - **bits**, bits of block.
- **String** - **difficulty**, difficulty of block.
- **String** - **hash**, block hash.
- **Integer** - **height**, block height.

## Example

Get difficulty for specified block hash / height.

### Request

```
curl -X POST http://localhost:9888/get-difficulty -d '{"block_height": 506, "block_hash": "d1fce60caea5466eae2b812e4586b55120c52aca27b6c92bd7c51e9cda82dcdf"}'
```

### Response

```
{  "bits": 2161727821137910500,  "difficulty": "15154807",  "hash": "d1fce60caea5466eae2b812e4586b55120c52aca27b6c92bd7c51e9cda82dcdf",  "height": 506}
```

# Get Hash Rate Endpoint

Returns the block hash rate by block height or block hash, it returns the current block hash rate when request is empty.

## Parameters

Object:

Optional:

- **String** - **block\_hash**, hash of block.
- **Integer** - **block\_height**, height of block.

## Returns

Object:

- **Integer** - **hash\_rate**, difficulty of block.
- **String** - **hash**, block hash.
- **Integer** - **height**, block height.

## Example

Get hash rate for specified block hash / height.

### Request

```
curl -X POST http://localhost:9888/get-hash-rate -d '{"block_height": 506, "block_hash": "d1fce60caea5466eae2b812e4586b55120c52aca27b6c92bd7c51e9cda82dcdf"}'
```

### Response

```
{  "hash": "d1fce60caea5466eae2b812e4586b55120c52aca27b6c92bd7c51e9cda82dcdf",  "hash_rate": 7577403,  "height": 506}
```

## Net Info Endpoint

Returns the information for the current network state.

## Parameters

None.

## Returns

Object:

- **Boolean** - **listening**, whether the node is listening.
- **Boolean** - **syncing**, whether the node is syncing.
- **Boolean** - **mining**, whether the node is mining.
- **Integer** - **peer\_count**, current count of connected peers.
- **Integer** - **current\_block**, current block height in the node's blockchain.
- **Integer** - **highest\_block**, current highest block of the connected peers.
- **String** - **network\_id**, network id.
- **Object** - **version\_info**, node's version information:
  - **String** - **version**, current version of the running node.
  - **uint16** - **update**, whether there exists an update.
    - 0: no update;
    - 1: small update;
    - 2: significant update.
  - **String** - **new\_version**, the newest version of the **core** if there is one.

## Example

Query the node for it's network state.

### Request

```
curl -X POST http://localhost:9888/net-info
```

### Response

```
{
  "listening": true,
  "syncing": false,
  "mining": false,
  "peer_count": 6,
  "current_block": 33409,
  "highest_block": 33409,
  "network_id": "mainnet",
  "version_info": {
    "version": "1.0.3",
    "update": 0,
    "new_version": "1.0.3"
  }
}
```

# Is Mining Endpoint

Returns the mining status.

## Parameters

None.

## Returns

Object:

- **Boolean** - **is\_mining**, whether the node is mining.

## Example

Retrieve the mining status.

## Request

```
curl -X POST http://localhost:9888/is-mining
```

## Response

```
{  
  "is_mining": true  
}
```

# Set Mining Endpoint

Start up node mining.

## Parameters

Object:

- **Boolean** - **is\_mining**, sets the value for the node's mining.

## Returns

Nothing in case the mining has been turned on or off.

## Example

Turn node mining on of off.

## Request

```
curl -X POST http://localhost:9888/set-mining -d '{"is_mining": true}'
```

## Response

Nothing if the operation was successful.
